Re: Solvay Wastebeds 9-15 Site, Towns of Camillus and Geddes, Onondaga County, NY
Site No. 73-40-76 (Consent Order Index # D-7-0001-02-03)
Closure Investigation Data Evaluation Report
Consent Order Deliverables

Dear Ms. Smith:

In accordance with the referenced Consent Order, Ramboll Americas Engineering Solutions, Inc. (Ramboll) has finalized the Closure Investigation and Data Evaluation Report on behalf of Honeywell to incorporate the Department's June 25, 2019 comments, in accordance with Honeywell's responses dated October 23, 2019, with the exception of the following updated comment responses:

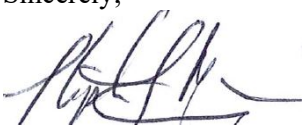
Comment 1: The executive summary states that the data evaluation was conducted to: a) understand the Site's current environmental setting and b) provide input to develop and implement the referenced plans. The report presents various trend analyses but does not present results of the data that have not trended. In particular, the report should include discussions of the locations of the most concentrated parameters and at a minimum shall include a table of groundwater standard exceedances and surface water standard exceedances, listing only those parameters that exceed standards and at which locations.
Response: Tables of constituents exceeding groundwater and surface water standards are included in the revised report as Appendix K, and summary statistics including the location of the maximum detected concentration are included as Tables 6-14. The full data set has been provided to NYSDEC in quarterly data table submittals.

Comment 4: Section 3.7.4, pg. 8 - Subsurface Leachate Manhole Location Variation - Significant differences across locations were identified for 15 of 20 parameters. Please describe the differences. Notably, the concentration plots of several parameters surrounding Wastebed #13 have lower and more consistent results. Are there any reasons for these differences?
Response: The following was added to Section 3.7.4:
"In general, lower and more consistent concentrations were observed in manhole locations surrounding WB 13. WB 13 was constructed differently than the other wastebeds, resulting in a thicker berm, and less seepage (OBG 2013, Dames & Moore 1975(a) and Dames & Moore 1976). "

This plan is a companion document to the previously submitted Site Closure Plan (December 31, 2020), Surrounding Affected Areas Restoration Plan (December 31, 2020), Operation and Maintenance Plan (February 19, 2021), Performance Verification Plan (March 25, 2021), and Shrub Willow Sustainable Remedy (SWSR) Pre-Design Investigation (PDI) Report (March 25, 2021).

Please contact Maureen Markert (315 420-7382) at Ramboll or me if you have any questions or comments.

Sincerely,



Stephen J. Miller, P.E.
Syracuse Remediation Program Manager

1. INTRODUCTION

1.1 Background

Honeywell International Inc. (Honeywell) and the New York State Department of Environmental Conservation (NYSDEC) have entered into an Administrative Consent Order (ACO; D-7-0001-02-03) for the Wastebeds (WB) 9-15 Site in Camillus and Geddes, New York. The ACO identifies activities required for the successful closure of WB 9-15. The closure of the Site encompasses an integrated program of environmental investigation, interim measures (IMs) to manage releases, a cover system, a leachate management system, and environmental benefit projects (EBPs).

Figure 1-1 Site Location

Field reconnaissance, field measurements, and sampling of surface leachate, groundwater, subsurface leachate, and surface water has been performed on a quarterly basis from 2012 through 2017, in accordance with the ACO and the September 2011 *Wastebeds 9-15 Site Closure*

Investigation Revised Work Plan (CIWP; O'Brien & Gere [OBG] 2011a), which was approved by the NYSDEC on October 18, 2011. Sample analyses were conducted in accordance with the 2011 CIWP, as modified by NYSDEC's letter dated January 14, 2015 approving a reduced list of monitoring parameters (NYSDEC 2015), and validated analytical data were submitted to NYSDEC quarterly. Initial comprehensive, site-wide closure investigation (CI) sampling was conducted over four quarters between the 1st quarter 2012 and 1st quarter 2013[1], and the results were documented in the August 2018 *Closure Investigation Report* (CIR; OBG 2018). This *Closure Investigation Data Evaluation Report* includes a compilation of data collected from 2nd quarter 2013 through 4th quarter 2017 (*i.e.*, 2013-2017 investigation period) and presents a statistical data evaluation for the complete data set from 2012 through 2017.

1.2 Report Objective

This *Closure Investigation Data Evaluation Report* presents a data review and statistical evaluation of quarterly data as a supplement to the *Site Closure Plan* (Ramboll 2020a) and *Off-Site Surrounding Affected Area (SAA) Restoration Plan* (Ramboll 2020b) for WB 9-15. The data evaluation was conducted to: a) understand the Site's current environmental setting and b) provide input to develop and implement the above-referenced plans.

2. SURFACE LEACHATE DATA EVALUATION

2.1 Objective

The objectives of the surface leachate (*i.e.*, seep) data evaluation included the following:

- Review seep reconnaissance and sampling/analysis activity over the monitoring period
- Summarize seep inspection observations, including seep locations, activity, flow directions and flow capture by seep mitigation or leachate collection systems, where applicable
- Review seep analytical data
- Identify seeps warranting further evaluation in the Site Closure Plan.

2.2 Surface Seep Quarterly Reconnaissance and Sampling/Analysis

A field reconnaissance is performed quarterly to observe formerly identified seep areas and identify areas of new seepage, if present. Potential seep locations are staked, marked with a handheld GPS unit, and photographed. During each quarterly reconnaissance, samples are collected from each seep with a flow sufficient to sample. Samples are typically analyzed one quarter per year for expanded parameters and three quarters per year for routine parameters as listed in 6 NYCRR §360-2.11 (d)(6), as modified by the CIWP (OBG 2011) and the January 2015 approved modification (Honeywell 2015 and NYSDEC 2015).

2.3 Surface Seep Inspection Observations

Observed seep locations are noted on **Figure 1** for WB 9-11, and on **Figure 2** for WB 12-15. Quarterly seep observations since 2013 are summarized on **Table 1**. **Table 1** and **Figures 1 and 2** indicate whether seep locations are inactive or active based on whether flow has been observed at each location. For active seeps, notes are included in the tables regarding capture of seeps by existing collection systems or where the seeps potentially migrate to, where applicable. Active seeps captured by collection systems are directed to the retention ponds and then pumped to the Metropolitan Syracuse Wastewater Treatment Facility (Metro) for treatment. Seep collection system locations are indicated on **Figures 1 and 2**. Management of active surface seeps is discussed in the Site Closure Plan.

2.4 Surface Seep Analytical Data

Surface seep samples are collected for analysis when sufficient flow is present for sample collection. **Table 2** summarizes the quarterly surface leachate sample locations and analytical parameters.

Seep locations do not have sufficient flow for sampling on a continuous basis each quarter; the number of seeps present varies between quarters. For example, the number of seep locations sampled during the 2017 quarters ranged from three locations (3rd quarter) to ten or more locations (remaining quarters). Surface seep activity is typically higher in the first two quarters

of the year. Between 2012 and 2017 most samples were collected during the first or second quarters, when flow sufficient for sampling was present.

Constituents observed in surface seep samples are generally consistent with constituents observed in subsurface leachate samples. As noted in **Table 1**, most active surface seeps are not migrating to surface water; with regard to the other active seeps, one location (CIWP-SP-10) remains for further evaluation to assess the management approach as part of the site closure program. Constituents detected at this location above Class C surface water standards in at least one sample include aluminum, cobalt and total dissolved solids (TDS). Aluminum exceeded the Class C Standards and Guidance value (SGV) of 0.1 mg/L (S) with a concentration of 0.4 mg/L and cobalt exceeded the Class C Standards and Guidance value of 0.005 mg/L (S) with a concentration of 0.0051 mg/L. TDS exceeded in both samples collected during the time period with concentrations of 5,100 mg/L and 6,400 mg/L compared to Class C standard of 500 mg/L. A summary of surface leachate parameters detected above Class C SGVs is provided in **Appendix K Tables K-1 through K-7** for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), inorganics, other compounds (additional water quality parameters), and dioxins/furans equivalence summary respectively.

3. GROUNDWATER, LEACHATE, AND SURFACE WATER DATA EVALUATION

3.1 Objective

The objectives of the groundwater, surface water, and leachate data evaluation included the following:

- Review groundwater field measurements, elevations and sampling/analysis
- Evaluate groundwater, leachate, and surface water data for time trends for each parameter at each location
- Evaluate detected concentrations and parameters in groundwater, leachate, and surface water for refinement of monitoring program.

3.2 Groundwater Field Measurements and Groundwater Elevations

Quarterly groundwater water level measurements within each monitoring well were recorded at 127 monitoring wells. The water levels measurements were collected before the start of the groundwater sampling. Water level measurements were referenced to the top of the PVC casing, unless specified otherwise. Groundwater specific gravity (density) measurements were collected via hydrometer from each location by lowering a bottom loading stainless steel bailer into the screen interval and removing a water sample for measurement. Seasonal fluctuations in measured elevations and ground water flow patterns have remained consistent with those discussed and presented in the Closure Investigation Report. **Figure 3** shows the quarterly groundwater gauging locations; **Table 3** presents a summary of quarterly water level measurements and calculated groundwater elevations, and **Appendix A** contains graphs of groundwater elevations over time.

3.3 Groundwater Quality Sampling and Analysis

Groundwater samples were collected quarterly from the wells listed in **Table 4**, in accordance with the sampling procedures in the 2011 CIWP. The sampling locations are presented on **Figure 4**. Groundwater sampling logs and field data are included in **Appendix B**.

In accordance with the 2011 CIWP, the groundwater samples collected from CI wells through 2014 were analyzed once per year for expanded parameters as listed in 6 NYCRR 360-2.11(d)(6), plus nitrate, with the exception that mercury was analyzed using USEPA Method 1631 and polychlorinated biphenyls (PCBs) were analyzed using USEPA Method 1668A (including Aroclor 1268), and for routine parameters as listed in Part 360-2.11(d)(6) in the remaining three quarters. Samples from the 17 monitoring wells that are associated with both the CI and the Sediment Consolidation Area (SCA) groundwater monitoring program were analyzed for the baseline parameters list each quarter.

In accordance with NYSDEC's letter dated January 14, 2015 approving a reduced list of monitoring parameters (NYSDEC 2015), the samples collected in 2015 through 2017 excluded hexavalent chromium by Method 7199, pesticides by Method 8141, herbicides by Method 8151, propionitrile and isobutyl alcohol by Method 8015, PCBs by Method 1668, and PCDD/PCDFs by Method 8290. Biological oxygen demand (BOD) sampling and analysis was also excluded in 2015 through 2017 except for the following locations: SB915-MW-42I, SB915-MW-88I, SB915-MW-92S, SB915-IMW-03S, SB915-MH-06, and SB915-MH-18.

A summary of the analyses performed at the locations sampled is included in **Table 4**. Analytical data summary tables for these samples were submitted to NYSDEC each quarter. Additional details on detections that exceed Class GA groundwater standards and guidance values is provided in **Section 3.7.6**.

3.4 Subsurface Leachate Quality Sampling and Analysis

Quarterly subsurface leachate samples were collected from the leachate collection system locations identified in **Table 4** in accordance with the sampling procedures in the 2011 CIWP (OBG 2011). The sampling locations are presented on **Figure 5**. The field data (*i.e.*, temperature, pH, turbidity, conductivity, and dissolved oxygen) are provided in **Appendix C.** Sample analyses are as described for groundwater samples in Section 3.3. A summary of the analyses performed at the locations sampled is included in **Table 4.** Analytical data summary tables for these samples were submitted to NYSDEC each quarter. Additional details on detections that exceed Class GA groundwater standards and guidance values for subsurface leachate is provided in **Section 3.7.7**.

3.5 Surface Water Quality Sampling and Analysis

Surface water samples were collected quarterly from on-site and off-site surface water features at the locations listed in **Table 4** in accordance with the sampling procedures in the 2011 CIWP. The sampling locations are presented on **Figure 6**. The field data (*i.e.*, temperature, pH, turbidity, conductivity, and dissolved oxygen) are provided in **Appendix D**. Sample analyses were as described for groundwater samples in Section 3.3. A summary of the analyses performed at the locations sampled is included in **Table 4**. Analytical data summary tables for these samples were submitted to NYSDEC each quarter. Additional details on detections that exceed Class C surface water standards and guidance values is provided in **Section 3.7.8**.

3.6 Data Evaluation Approach

Statistical evaluations of time trends and variations were performed for groundwater, subsurface leachate, and surface water analytical data from 2012 through 2017; statistical evaluation methods are described in **Sections 3.6.1 and 3.6.2**. The analytical data set for groundwater, surface water, and leachate from 2012 through 2017 was also reviewed with respect to frequency of individual parameter detections and standard exceedances across the Site.

3.6.1 Time Trends

Statistical time trend tests were performed on analytical data from the 2012 through 2017 using the Mann-Kendall (MK) tests. Prior to running these tests, data screening steps were performed to reduce the chances of statistical errors (false positive or false negative tests). Data screening steps are summarized in Appendix E. Data screening resulted in data being excluded for methods discontinued in 2015 and being excluded for data rejected during the data validation process.

For time trend analyses of parameter concentrations in groundwater, subsurface leachate, and surface water, MK tests were performed on data sets of each unique parameter and sample location combination that passed the screening tests outlined in Appendix E. The MK test is frequently used to detect linear time trends in data (e.g., Vousoughi et al. 2013). Rather than using raw values for concentration or time, this test uses ranked values. This test is favored for time trend analysis because:

- Use of ranks eliminates the influence of outliers
- Use of ranks limits the influence of censored data (e.g., non-detects), which are common in environmental data and the data used for this evaluation; and
- The test does not require normally distributed data to provide a reliable test of significance (Gilbert 1987, Helsel and Hirsch 2002).

In sum, using the MK approach has no assumptions regarding data distribution and reduces the likelihood of falsely indicating declining or increasing time trends using ranked data.

Statistical significance of the MK tests was set to an alpha value of 0.01 to account for the numerous tests being run. Statistical significance is often assessed at an alpha value of 0.05, which means that out of a theoretical set of 100 statistical tests, up to 5 may be significant due to random chance alone. Given that over 9,000 MK tests were run, approximately 450 significant results could have been generated by random chance. In order to avoid generating a large number of false positive tests, alpha values are often adjusted down by dividing 0.05 by the number of tests being run. However, in this case the resulting alpha value would have been unreasonably low, therefore an alpha value of 0.01 was used as a reasonable conservative value.

Another factor in assessing the significance of statistical tests was the pattern of detection limits over time. In cases where a parameter concentration was a non-detect, ½ the detection limit value was used. For parameters that had many non-detects, varying detection limits over time could generate significant statistical tests. To limit the prevalence of such false positives, significant statistical tests were only considered if at least 25% of the values were true detects.

The results of the time trend analyses are discussed in **Section 3.7**.

3.6.2 Analysis of Variance

Analysis of variance (ANOVA) was used to evaluate if concentrations differed among quarters for groundwater, subsurface leachate, and surface water analytical data from 2012 through 2017. ANOVA was also used to evaluate whether concentrations differed between subsurface leachate

manhole locations. Prior to running the ANOVAs, screening steps were performed to reduce the chances of statistical errors (false positive or false negative tests), which included removal of data for methods discontinued in 2015, removal of data rejected during the validation process, and limitation to 20 parameters that are monitored quarterly from the routine parameter list. In addition, detections from a minimum of three quarters for each parameter and location combination were needed to perform the statistical evaluation.

ANOVAs were performed for each unique parameter (n = 20) and sample location (n = 136) combination to test if mean concentrations by quarter were statistically different. Statistical significance of the ANOVA tests was set to an alpha value of 0.01 to account for the numerous tests being run.

The results of the ANOVAs are discussed in **Section 3.7**.

3.7 Data Evaluation Results

The results of time trend analyses are discussed in **Sections 3.7.1 through 3.7.3** for groundwater, subsurface leachate, and surface water, respectively, ANOVA is discussed in **Section 3.7.4**, and the parameter detection and exceedance frequencies are discussed in **Section 3.7.5**. Parameter detections with relation to NYS water quality standards and guidance values are discussed in **Sections 3.7.6 through 3.7.8**.

3.7.1 Groundwater Time Trends

Groundwater samples are collected quarterly from 95[2] monitoring wells on WB 9-15. Ninety-four percent of parameter and location combinations have no statistically significant trend; 6% of the parameter and location combinations were statistically significant. No overall trends of concern were noted in individual wells or in the different hydrogeologic units. Results of time trend analyses are presented in **Appendix F**, and include a tabular summary of significant trends, figures for each hydrogeologic unit depicting significant trends spatially, and graphs for parameter/location combinations that exhibit significant trends. Positive values indicate increasing trends over time, negative values indicate decreasing trends, and stronger trends have values closer to 1 or -1 than to 0.

3.7.2 Subsurface Leachate Time Trends

Subsurface leachate samples are collected quarterly from 20 leachate manholes. Ninety-seven percent of parameter and location combinations have no statistically significant trend; 3% of the parameter and location combinations were statistically significant. No overall trends of concern were noted at individual locations or across the locations. Results of time trend analyses are presented in **Appendix G** and include a tabular summary of significant trends, figures for each hydrogeologic unit depicting significant trends spatially, and graphs for parameter and location combinations that exhibit significant trends.

3.7.3 Surface Water Time Trends

Surface water samples are collected quarterly from 21 locations. Ninety-eight percent of parameter and location combinations have no statistically significant trend; 2% of the parameter and location combinations were statistically significant. No overall trends of concern were noted

[2] Five of the 100 wells identified for sampling are consistently dry and have not been sampled.

at individual locations or across the locations. Results of time trend analyses are presented in **Appendix H** and include a tabular summary of significant trends, figures for each hydrogeologic unit depicting significant trends spatially, and graphs for parameter and location combinations that exhibit significant trends.

3.7.4 Analysis of Variance

Quarterly variation

As discussed in Section 3.6.2, ANOVA was used to evaluate data variability between quarters. Ninety-five percent of parameter and location combinations have no statistically significant trend; 5% of the parameter and location combinations were statistically significant. The limited percentage of significant trends indicates that overall constituent concentrations do not significantly vary seasonally. ANOVA results are included in Appendix I.

Subsurface leachate manhole location variation

ANOVA was also used to evaluate subsurface leachate data variability between manhole locations. Significant differences across locations were identified for 15 of the 20 parameters evaluated. Although there are significant differences across locations, concentrations are generally consistent in the manholes located along individual wastebeds, ANOVA results are included in Appendix J.

In general, lower and more consistent concentrations were observed in manhole locations surrounding WB 13. WB 13 was constructed differently than the other wastebeds, resulting in a thicker berm, and less seepage (OBG 2013, Dames& Moore 1975(a) and Dames & Moore 1976).

3.7.5 Parameter Detection and Exceedance Frequency Evaluation

Table 5 presents a summary of the parameter detection and exceedance frequency evaluation, including an indication of statistically significant trends (increasing and decreasing) in groundwater, subsurface leachate, and surface water. Of the parameters regularly analyzed, 49.5% have never been detected, or have been detected in less than 5% of samples at concentrations below standards. Furthermore, these parameters have exhibited concentrations that do not represent a significant increasing trend. This information should result in refinement of the monitoring programs as part of the Site Closure Plan and SAA Restoration Plan.

3.7.6 Groundwater Analytic Summary

A summary of groundwater parameters detected above Class GA groundwater standards and guidance values (SGVs) are provided in **Appendix K Tables K-8 through K-13** for VOCs, SVOCs, PCBs, inorganics, other data (additional water quality parameters), and dioxins/furans equivalence summary respectively. Sample locations are presented on **Figure 4**.
Summary statistics for detected constituents compared to Class GA groundwater standards have been organized into five groups based on the hydrogeologic units presented in the CIR (OBG

2018), shallow groundwater – Solvay waste/shallow fill (**Table 6**), shallow native groundwater (**Table 7**), intermediate native groundwater (**Table 8**), deep native groundwater (**Table 9**), and bedrock groundwater (**Table 10**). **Tables 6 through 10** also present the location or locations of the highest detected concentration.

The nature and extent of parameters in the quarterly groundwater sampling results (2nd Quarter 2013 through 4th quarter 2017) are generally consistent with the results presented in the CIR (1st Quarter 2012 through 1st quarter 2013) (OBG 2018). Statistical variations in trends are discussed in prior sections. A discussion of groundwater geochemistry, and potential influences from wastebed leachate and native brines, is provided in the WB 9-15 CIR (OBG 2018).

3.7.7 Subsurface Leachate Analytic Summary

A summary of subsurface leachate parameters detected above Class GA Groundwater SGVs are provided on **Appendix K Tables K-14 through K-19** for VOCs, SVOCs, pesticides, inorganics, other data, and dioxins/furans equivalence summary respectively, and sample locations are presented on **Figure 5**. WB 12-15 and WB 9-11 were evaluated separately for discussion purposes.

Summary statistics for detected constituents compared to Class GA Groundwater SGVs are provided in **Table 11** for subsurface leachate parameters detected in in the leachate collection and conveyance system (LCCS) around WB 12-15 and **Table 12** for subsurface leachate parameters detected in collections systems around WB 9-11 during the reporting period. **Tables 11 and 12** also present the location or locations of the highest detected concentrations.
The nature and extent of parameters in the quarterly subsurface leachate sampling results are generally consistent with the CIR (OBG 2018). Statistical variations in trends are discussed in prior sections.

3.7.8 Surface Water Analytic Summary

A summary of surface water parameters detected above Class C Surface Water SGVs are provided on **Appendix K Tables K-20 through K-26** for VOCs, SVOCs, pesticides, PCBs, inorganics, other data, and dioxins/furans equivalence summary respectively. These results were compared against the applicable New York State Class C Ambient Water Quality Standards and Guidance Values (NYSDEC, 1998). For parameters that have more than one Class C standard, the most conservative standard was used for comparison purposes. It should be noted that the most conservative standards may not be directly applicable to each surface water sampling location (*e.g.*, Class C H(FC) for human consumption of fish in fresh water would not be directly applicable to the former gravel pit). Per the NYSDEC, Class C surface waters are suitable for fishing, shellfish, and wildlife propagation and survival, as well as primary and secondary contact recreation. Hardness-dependent metals Class C standards were calculated using a value of 2,212.6 mg/L, which was the average hardness for all surface water samples collected during the four quarters associated with the CIR.

Surface water samples collected were broken into two groups, site-related analytical results (Outfalls 011, 017, 018, and 019, the Gravel Pit, Iron Brook, Retention Pond 1, Retention Pond 2-1 and 2-2, Interbed 1, 2, and 3, and the Ponded Area North of WB 11) and Ninemile Creek (NMC) analytical results. Sample locations are presented on **Figure 6**.

Summary statistics are provided in **Table 13** for surface water parameters detected at site surface water locations sampled during the reporting period. Summary statistics are provided in **Table 14** for surface water parameters detected at Ninemile Creek locations sampled during the reporting period. **Tables 13 and 14** also present the location or locations of the highest detected concentrations.

The nature and extent of parameters in the quarterly surface water sampling results are generally consistent with the CIR (OBG 2018). Statistical variations in trends are discussed in prior sections.

4. CONCLUSIONS

- Statistical time trend tests of concentration data indicated there are no trends of concern at individual sample locations or in the different media and hydrogeologic units.
- The nature and extent of constituents including spatial and magnitude of standards and guidance values exceedances are generally consistent with the findings of the WBs 9-15 Closure Investigation (OBG 2018).
- ANOVA between quarters indicated that:
    - constituent concentrations do not significantly vary seasonally
    - concentrations varied between subsurface leachate sample locations, yet are generally consistent in the manholes located along individual wastebeds.
- Results of the statistical evaluation of quarterly of groundwater, subsurface leachate, and surface water data collected from 2012 through 2017 support refinements in the site monitoring program as part of the Site Closure Plan and SAA Restoration Plan.[3]
- Field observations provide sufficient information to evaluate active surface seep management in the Site Closure Plan.

[3] 49.5% of the parameters analyzed have either never been detected, or have been detected in less than 5% of the samples at concentrations below standards and at concentrations that do not represent a significant increasing trend.

Notes:

[1] Samples collected for routine parameters.

[2] Samples collected for expanded parameters.

[3] No sample collected; Seep flow to another seep that was collected

[4] Flowing but not sampled

Legend

NF	No Flow
TF	Trace Flow
F	Flowing
D	Dry; No Flow
S	1-2 feet of Snowpack
P	Pooled/Ponded Water, Not Sampled
M	Moist Surface
C	Construction area, no observed flow
N	Could not locate seep
NA	No Data; Time period before observati
NO	Seep flow not observable, NMC water

Dry - Monitoring Well was dry
NA - Not Available
NA1 - Not enough water for Specific Gravity
NA2 - Monitoring Well is obstructed
NA3 - Monitoring Well is broken

Dry - Monitoring Well was dry
NA - Not Available
NA1 - Not enough water for Specific Gravity
NA2 - Monitoring Well is obstructed
NA3 - Monitoring Well is broken

Dry - Monitoring Well was dry
NA - Not Available
NA1 - Not enough water for Specific Gravity
NA2 - Monitoring Well is obstructed
NA3 - Monitoring Well is broken

TABLE 5 *Detected Parameter Evaluation Results*

Parameter Name	Never detected in GW, SW, or Leachate	Detected in between 0% and 5% of samples in GW, SW, or Leachate	Detected in greater than 5% of samples for at least one media	Detected above standards in GW, SW, or Leachate	Presence of significant trend at one or more sample locations
Other Methods					
Mercury			X	X	X (2-)
Bromide			X	X	X (1+, 5-)
Chloride			X	X	X (2+,25-)
Nitrate			X	X	
Nitrite			X		
Sulfate			X	X	X (14+, 3-)
Ammonia			X	X	X (1+, 10-)
Nitrogen, Kjeldahl			X		X (15-)
Chemical Oxygen Demand			X		X (46-)
Phenolics, Total Recoverable			X	X	X (7-)
Dissolved Oxygen			X	X	X (2-)
pH			X	X	
Turbidity			X	X	X (2+)
Alkalinity			X		X (48+)
Alkalinity, Bicarbonate			X		X (43+)
Alkalinity, Carbonate			X		X (4+)
HARDNESS (AS CACO3)			X		X (6+, 25-)
Solids, Total Dissolved			X	X	X (3+, 8-)
Biochemical Oxygen Demand			X		
TOTAL ORGANIC CARBON			X		X (39-)
Cyanide			X	X	X (1+)
Method 6010					
Aluminum			X	X	X (4+)
Antimony			X	X	
Arsenic			X	X	X (2+)
Barium			X	X	X (2-)
Beryllium		X		X

3rd Quarter 2013 Groundwater Sampling Logs

O'BRIEN & GERE — Low Flow Groundwater Sampling Log

Well ID: SB915-MW42I
Northing:
Easting:

Site Name: SB915 Closure
Site Location: Camillus, NY
Project #: 1163.48127
Sampling Method: Low Flow / Purge
Equipment Used: grundfos / Bailer
Pump/Controller ID#:
Field Personnel: Cah
Date: 9-10-13
Weather: Cloudy, muggy, 70

Well information:

Installed Depth of Well*: ft. bmp.
Measured Depth of Well*: 70.08 ft. bmp.
Depth to Water*: 47.82 ft.
Length of Water Column (LWC): in.
Well Diameter: ft. bmp.

Well Volume Multipliers:

- ☐ 1 in. = 0.041 gal/ft
- ☒ 2 in. = 0.163 gal/ft
- ☐ 4 in. = 0.653 gal/ft
- ☐ 6 in. = 1.469 gal/ft
- ☐ 8 in. = 2.611 gal/ft

* Measurement Point:

- ☐ Well Casing
- ☐ Protective Casing
- ☐ Other:

Well Volume: gal.
Pump Intake Depth*: ft. bmp.

Start Purge Time: 1025
Initial Observations: Color Milky Odor No Sheen/Free Product No

O'BRIEN & GERE — Low Flow Groundwater Sampling Log

Well ID: SB915-MW-111S
Northing:
Easting:

Site Name: SB915 Closure / SCA
Site Location: Camillus, NY
Project #: 1163.51008
Sampling Method: Low Flow
Equipment Used: Peristaltic
Pump/Controller ID#: FA 00138
Field Personnel: ~~5/9/14~~ KSK
Date: 5/9/14
Weather: Overcast ~75°F

Well information:

Installed Depth of Well*: ____ ft. bmp.
Measured Depth of Well*: 24.40 ft. bmp.
Depth to Water*: 7.66 ft.
Length of Water Column (LWC): 16.74 in.
Well Diameter: ____ ft. bmp.

Well Volume Multipliers:

☐ 1 in. = 0.041 gal/ft
☑ 2 in. = 0.163 gal/ft
☐ 4 in. = 0.653 gal/ft
☐ 6 in. = 1.469 gal/ft
☐ 8 in. = 2.611 gal/ft

* Measurement Point:
☑ Well Casing
☐ Protective Casing
☐ Other: ____

Well Volume: ____ gal.
Pump Intake Depth*: ____ ft. bmp.

Start Purge Time: 1030
Initial Observations: Color Clear Odor None Sheen/Free Product None

O'BRIEN & GERE — Low Flow Groundwater Sampling Log

Well ID: SB915-MW-105BR
Northing:
Easting:

Site Name: SB915 Closure / SCA
Site Location: Camillus, NY
Project #: 1163.51008
Sampling Method: Low Flow
Equipment Used: Grundfos
Pump/Controller ID#: 1817
Field Personnel: KJK
Date: 12/4/14
Weather: Mostly Sunny ~25°

Well Information:
Installed Depth of Well*: ft. bmp.
Measured Depth of Well*: 65.50 ft. bmp.
Depth to Water*: 60.40 ft.
Length of Water Column (LWC): in.
Well Diameter: ft. bmp.

Well Volume Multipliers:
☐ 1 in. = 0.041 gal/ft
☒ 2 in. = 0.163 gal/ft
☐ 4 in. = 0.653 gal/ft
☐ 6 in. = 1.469 gal/ft
☐ 8 in. = 2.611 gal/ft

*** Measurement Point:**
☐ Well Casing
☒ Protective Casing
☐ Other:
Well Volume: gal.
Pump Intake Depth*: ft. bmp.

Start Purge Time: 1041
Initial Observations: Color Clear Odor None Sheen/Free Product None

indicate units

Well ID: SB915-MW-107I
Northing:
Easting:

Site Name: SB915 Closure / SCA
Site Location: Camillus, NY
Project #: 1163.51008
Sampling Method: GrundFos/Low Flow
Equipment Used: Grundfos
Pump/Controller ID#: PN0095A00
Field Personnel: JAK
Date: 10/27/14
Weather: ~50°F Partly cloudy

Well information:
Installed Depth of Well*: ____ ft. bmp.
Measured Depth of Well*: ____ ft. bmp.
Depth to Water*: 7.83 ft.
Length of Water Column (LWC): ____ in.
Well Diameter: ____ ft. bmp.

Well Volume Multipliers:
☐ 1 in. = 0.041 gal/ft
☒ 2 in. = 0.163 gal/ft
☐ 4 in. = 0.653 gal/ft
☐ 6 in. = 1.469 gal/ft
☐ 8 in. = 2.611 gal/ft

* Measurement Point:
☒ Well Casing
☐ Protective Casing
☐ Other: ____
Well Volume: ____ gal.
Pump Intake Depth*: ____ ft. bmp.

Start Purge Time: 1105
Initial Observations: *Color* Light Brown *Odor* None *Sheen/Free Product* None

O'BRIEN & GERE — Low Flow Groundwater Sampling Log

Well ID: SB915-MW-85D
Northing:
Easting:

Site Name: SB915 Closure / SCA
Site Location: Camillus, NY
Project #: 1163.51008
Sampling Method: Low Flow
Equipment Used: Peri pump
Pump/Controller ID#: FAO
Field Personnel: JWB, CAH, ASF
Date: 3.6.15
Weather: Sun, 10°F

Well information:
Installed Depth of Well*: ft. bmp.
Measured Depth of Well*: 79.75 ft. bmp.
Depth to Water*: 13.40 ft.
Length of Water Column (LWC): in.
Well Diameter: ft. bmp.

Well Volume Multipliers:
☐ 1 in. = 0.041 gal/ft
☒ 2 in. = 0.163 gal/ft
☐ 4 in. = 0.653 gal/ft
☐ 6 in. = 1.469 gal/ft
☐ 8 in. = 2.611 gal/ft

* Measurement Point:
☒ Well Casing
☐ Protective Casing
☐ Other:
Well Volume: gal.
Pump Intake Depth*: ft. bmp.

Start Purge Time: 11:06
Initial Observations: Color light white Odor NO Sheen/Free Product NO

indicate units

Well ID: SB915-MW-36I
Northing:
Easting:

Site Name: SB915 Closure / SCA
Site Location: Camillus, NY
Project #: 1163.51008
Sampling Method: Low-Flow
Equipment Used: GRUNDFOS
Pump/Controller ID#:
Field Personnel: AJF
Date: 3/5/15
Weather: Windy, Overcast, ~14°F

Well information:
Installed Depth of Well*: ft. bmp.
Measured Depth of Well*: 64.37 ft. bmp.
Depth to Water*: 40.82 ft.
Length of Water Column (LWC): in.
Well Diameter: ft. bmp.

Well Volume Multipliers:
☐ 1 in. = 0.041 gal/ft
☑ 2 in. = 0.163 gal/ft
☐ 4 in. = 0.653 gal/ft
☐ 6 in. = 1.469 gal/ft
☐ 8 in. = 2.611 gal/ft

* Measurement Point:
☑ Well Casing
☐ Protective Casing
☐ Other:
Well Volume: gal.
Pump Intake Depth*: ft. bmp.

Start Purge Time: 1123
Initial Observations: *Color* Clear *Odor* No *Sheen/Free Product* No

indicate units

O'BRIEN & GERE — Low Flow Groundwater Sampling Log

Well ID: SB915-MW-107BR
Northing:
Easting:

Site Name: SB915 Closure / SCA | Sampling Method: Low Flow | Field Personnel: TBP
Site Location: Camillus, NY | Equipment Used: Grund Fos | Date: 3/4/15
Project #: 1163.51008 | Pump/Controller ID#: FA00137 / FA00636 | Weather: 20's Cloudy

Well information:
Installed Depth of Well*: ft. bmp.
Measured Depth of Well*: 19.35 ~~133.5~~ ft. bmp.
Depth to Water*: 19.35 ft.
Length of Water Column (LWC): 114.2 in.
Well Diameter: ft. bmp.

Well Volume Multipliers:
☐ 1 in. = 0.041 gal/ft
☒ 2 in. = 0.163 gal/ft
☐ 4 in. = 0.653 gal/ft
☐ 6 in. = 1.469 gal/ft
☐ 8 in. = 2.611 gal/ft

*** Measurement Point:**
☒ Well Casing
☐ Protective Casing
☐ Other:
Well Volume: 18.61 gal.
Pump Intake Depth*: ft. bmp.

Start Purge Time: 10~~7~~15
Initial Observations: *Color* Clear *Odor* None *Sheen/Free Product* None

O'BRIEN & GERE — Low Flow Groundwater Sampling Log

Well ID: SB915-PZ-07D

Site Name: SB915 Closure / SCA | Sampling Method: Low Flow | Field Personnel: SB915-PZ-07D TBP
Site Location: Camillus, NY | Pump Type Used: Grundfos | Date: 7/31/15
Project #: 1163.61104 | Pump/Controller ID#: 15333 | Weather: 80's Sunny

Well Information:
Installed Depth of Well*: _____ ft. bmp
Measured Depth of Well*: 65.51 ft. bmp
Depth to Water*: 31.35 ft.
Length of Water Column: _____ ft.

Well Volume Multipliers:
2 in. = 0.163 gal/ft
Well Volume: _____ gal.
Pump Intake Depth*: _____ ft. bmp

*** Measurement Point:**
☑ Well Casing
☐ Protective Casing
☐ Other: _____

Start Purge Time: 10:19
Initial Observations: Color: clear Odor: NO Sheen/Free Product: NO

Elapsed Time (minutes)	Depth to Water (ft bmp)	Temperature (°C)	pH (S.U.)	Specific Conductivity (µS/cm mS/cm) *circle units*	ORP (mV)	Dissolved Oxygen (mg/L)	Turbidity (NTU)	Flow Rate (mL/min)	Specific Gravity

Notes: _____

O'BRIEN & GERE — Low Flow Groundwater Sampling Log

Well ID: SB915-DMW-03S

Site Name:	SB915 Closure / SCA	Sampling Method:	Low Flow	Field Personnel:	TBP
Site Location:	Camillus, NY	Pump Type Used:	Peristaltic	Date:	10/22/15
Project #:	1163.61104	Pump/Controller ID#:	FA01816	Weather:	50's Cloudy

Well Information:

Installed Depth of Well*: _____ ft. bmp
Measured Depth of Well*: 26.1 ft. bmp
Depth to Water*: 7.65 ft.
Length of Water Column: _____ ft.

Well Volume Multipliers:
2 in. = 0.163 gal/ft
Well Volume: _____ gal.
Pump Intake Depth*: _____ ft. bmp

*** Measurement Point:**
☒ Well Casing
☐ Protective Casing
☐ Other: _____

Start Purge Time: 1031

Initial Observations: Color: Clear/Blackish Bucket Odor: Sulfur Sheen/Free Product: NO

Elapsed Time (minutes)	Depth to Water (ft bmp)	Temperature (°C)	pH (S.U.)	Specific Conductivity (µS/cm (mS/cm)) *circle units*	ORP (mV)	Dissolved Oxygen (mg/L)	Turbidity (NTU)	Flow Rate (mL/min)	Specific Gravity
