Notes: *Possibly due to suspended solids - notable residue on gloves.
*Losing flow, pump had trouble despite ample water column/ low DO.

APPENDIX E
ANALYSIS SCREENING STEPS

Appendix E

Appendix E-1 Screening Steps Applied to the Overall Data Set

Step	Sample size
Overall data set	365,419
Remove data for methods eliminated from monitoring program in January 2015	280,876
Remove lines of data with an "R" validation qualifier	278,319
Remove duplicate records	276,831
Join standards information	276,831

Appendix E-2 Screening Steps Applied to the Groundwater, Surface Water, Subsurface Leachate Data and Ninemile Creek.

Screening Step	Groundwater	Surface Water	Subsurface Leachate	Notes
Initial data set size	194,822	42,665	39,334	The groundwater, surface water, and subsurface leachate data sets were used to perform time trend tests.
Total starting number of parameters	262	258	256	
Total starting number of sample locations	100	21	20	
Remove parameters that do not have a detect anywhere in the groundwater dataset				Removes parameters that were sampled but not detected
Data set size after detect screen	147,456	26,208	26,146	
Number of parameters remaining after detect screen	178	123	133	
Remove parameters that have a standard but do not have a standard exceedance in any of the sample locations				The groundwater and subsurface leachate standard was the NYS GA. The surface water data were compared to Class C standards. Surface water samples in the Gravel Pit were also compared to the NYS GA because the gravel pit Outfall 017 is classified as a groundwater discharge. Standard exceedances must be "detects" to be retained.
Data set size after exceedance screen	112,798	20,317	19,190	
Number of parameters remaining after exceedance screen	113	96	79	
At a given sample location, remove parameters with a sample size less than 3				A minimum of three samples was used to run statistical trend tests

Screening Step	Groundwater	Surface Water	Subsurface Leachate	Notes
Data set size after sample size screen	111,730	20,275	19,152	
Number of parameters remaining after sample size screen	104	82	76	
Number of unique parameter x sample location combinations at beginning of GW dataset	23,069	5,151	4,888	Prior to the screening steps, there were this many parameter x sample location combinations
Number of unique parameter x sample location combinations prior to statistical test (i.e., number of tests run)	9,163	1,722	1,505	After the screening steps, there were this many parameter x sample location combinations
Number of significant tests at $p<0.01$	763	31	157	
Number of significant trends after removing those with a detection rate less than 25%	514	28	41	This filter aims to eliminate false positives due to varying detection limits over time. That is, if a given parameter x sample location data set has more than 75% non-detects, the corresponding statistical test was not used because varying detection limits over time could drive significant results.
