APPENDIX A	DATA USABILITY AND SUMMARY REPORT: ONONDAGA LAKE 2012 TISSUE MONITORING: FISH AND ZOOPLANKTON
-------------------	--

LIST OF ACRONYMS

CPUE	catch (of fish) per unit of effort
DDT	dichloro diphenyl trichloroethane
DUSR	Data Usability and Summary Report
mg/kg	milligrams per kilogram (or parts per million in water)
NYSDEC	New York State Department of Environmental Conservation
PCBs	polychlorinated biphenyls
PIT	passive integrated transponder
PHM	Permanent Habitat Module
QA/QC	quality assurance / quality control
RI	remedial investigation
ROD	Record of Decision
SMU	sediment management unit
SUNY-ESF	State University of New York College of Environmental Science and Forestry
UFI	Upstate Freshwater Institute
USEPA	United States Environmental Protection Agency

DEFINITIONS

Benthic	Bottom dwelling (<i>i.e.</i> , in sediment)
Littoral	Zone within a body of water adjacent to shore where waters do not thermally stratify. In Onondaga Lake, the outer extent of the littoral zone corresponds to a water depth of 30 ft. (9 meters).
ng/L	Nanogram per liter or part per trillion in water. 1 ng/L is the same as 0.000001 milligram per liter (mg/L) or part per million.
Profundal	Offshore zone within a water body where water depths are greater than the depth to which sunlight can penetrate to support aquatic plants, in contrast with the littoral zone closer to shore. In Onondaga Lake, the profundal zone stratifies each year from May to October based on water temperature. The profundal zone of Onondaga Lake occupies 64 percent of the lake surface area based on a minimum water depth of 30 ft. (9 meters).

EXECUTIVE SUMMARY

The objectives of tissue and biological monitoring conducted on behalf of Honeywell in 2012 were to document conditions in Onondaga Lake based on parameters established to evaluate the effectiveness of lake remediation. This report includes results from the 2012 Onondaga Lake tissue monitoring and fish community monitoring efforts consistent with two different work plans approved by the New York State Department of Environmental Conservation (NYSDEC).

Adult sport fish and also alewife and gizzard shad prey fish tissue sampling were completed in June before the first year of lake sediment dredging was initiated in late July 2012; the remaining prey fish tissue sampling was completed in August. Fish community and zooplankton monitoring were conducted before and after the start of dredging.

Preliminary remediation goals as fish tissue chemical concentrations were established for fish in the lake bottom Record of Decision (ROD) issued by the NYSDEC and the United States Environmental Protection Agency (USEPA) in 2005. Fish tissue monitoring that was completed in 2012 included collection and chemical analysis of 75 adult sport fish and 40 composited samples of prey fish, fish community assessments and fish population surveys. Fish community monitoring was conducted to maintain continuity with fish community data collected from 2008 through 2011 that helps to characterize fish community dynamics in Onondaga Lake prior to habitat restoration. Zooplankton mercury concentrations were monitored in 2012 as a continuation of lake monitoring work conducted since 2008 to help assess mercury movement within the lake's food web.

SECTION 1

INTRODUCTION

Tissue and biological monitoring in Onondaga Lake were conducted on behalf of Honeywell in 2012 to document lake conditions during the year when remedial dredging and capping in the lake were initiated. Tissue monitoring forms a portion of the basis for evaluating the effectiveness of the lake bottom remedy identified in the ROD issued by the NYSDEC and the USEPA (NYSDEC and USEPA, 2005) and described in the *Remedial Design Work Plan for the Lake Bottom* (Parsons, 2009). Fish community monitoring provides data to help facilitate an understanding of fish community dynamics in Onondaga Lake. Most of the 2012 tissue and biological monitoring was conducted in the lake before July 17, 2012 when the first year of dredging was initiated. Capping of lake sediment was initiated following the start of dredging.

The program objectives for fish tissue and fish community monitoring completed in 2012 were to provide additional data for future understanding of:

- Remedy effectiveness in achieving remediation goals for Onondaga Lake
- Fish community response to habitat restoration

As in previous years, the 2012 work scope for tissue monitoring efforts was submitted as a work plan approved by NYSDEC (Parsons, Anchor QEA and Exponent, 2012b). The 2012 work scope for fish community monitoring was submitted as a separate work plan also approved by NYSDEC (Parsons and Anchor QEA, 2012). Tissue and fish community monitoring objectives, program elements, and data uses are presented in Table 1.

This report follows the format applied in the Baseline Monitoring Reports for Onondaga Lake for 2008 through 2011 (Parsons, Exponent, and Anchor QEA, 2011a, 2011b, 2011c and 2012). Section 1 provides an introduction. Section 2 presents a summary of the sampling and analytical work. Section 3 provides a summary of data management and data validation. Section 4 presents a brief assessment of the 2012 tissue data. Appendix A provides the 2012 Data Usability and Summary Reports (DUSR) for tissue monitoring and follows the format from prior monitoring years including laboratory data verification, data validation, and data usability.

SECTION 2

SAMPLING AND ANALYSIS SUMMARY FOR 2012

Sample collection, sample management, equipment decontamination, and other lake monitoring field procedures were conducted in accordance with work plans for tissue and biological monitoring approved in advance by NYSDEC (Parsons, Anchor QEA and Exponent, 2012b and Parsons and Anchor QEA, 2012). Field and analytical procedures used to conduct the work reported herein are documented in a quality assurance project plan (Parsons, Anchor QEA and Upstate Freshwater Institute (UFI), 2012). Surface water and sediment trap monitoring completed as part of the work scope for the 2012 portion of the nitrate addition pilot test (Parsons and UFI, 2012) are summarized in the report for 2012 nitrate addition efforts (Parsons and UFI, 2013). Table 2 summarizes the media, sampling locations, and primary activities completed for the 2012 tissue monitoring efforts.

Each of the 2012 tissue monitoring efforts were completed using standard procedures described in a quality assurance project plan (Parsons, Anchor QEA and Upstate Freshwater Institute, 2012).

2.1 FISH SAMPLING

Fish tissue monitoring during 2012 included adult sport fish and prey fish sample collection throughout the lake (Figure 1). Fish sampling for tissue chemical analyses was conducted by Anchor QEA with assistance from the Onondaga County Department of Water Environment Protection and the State University of New York College of Environmental Science and Forestry (SUNY-ESF). Fish population and community assessments (including lake sturgeon) were conducted during 2012 throughout the lake (Figure 2) primarily by SUNY-ESF under the supervision of Dr. Neil Ringler with support and oversight by Anchor QEA.

Sampling locations for fish tissue chemical analyses were the same as those occupied during 2008 through 2011, coinciding with historical locations sampled for fish tissue during the remedial investigation for Onondaga Lake (TAMS Consultants, 2002), as well as locations sampled as part of Onondaga County's Ambient Monitoring Program.

Adult sport fish sampling for tissue chemical analyses was conducted from June 14 through July 3, 2012. Prey fish sampling for tissue chemical analyses was conducted from June 14 to June 20 for alewife and gizzard shad and on August 8 and August 9 for other prey fish. Fish samples for tissue analyses were collected and analyzed using the same methods as prior years, including electrofishing, gill netting, trap netting, and seining. Electrofishing was the preferred method for sampling brown bullhead, because bullhead tend to move inshore during the night and are susceptible to capture. Trap nets were a secondary source for collection of bullhead which can be captured in these passive nets while moving along the shoreline. Walleye and smallmouth bass were primarily captured in gill nets set at the 13- to 23-ft. (4- to 7-meter) water depth also during night time hours when walleye and smallmouth bass are more active.

Occasionally, walleye or smallmouth bass were captured by electroshocking. Prey fish were captured with seines and gill nets along the shoreline where they typically congregate during day time hours.

Samples from three adult sport fish species and three prey fish families were collected for tissue chemical analyses. For adult sport fish, 25 individuals from each of the three species [smallmouth bass (*Micropterus dolomieu*), walleye (*Sander vitreus*), and brown bullhead (*Ameiurus nebulosus*)], were targeted from eight locations (based on a target of three to four individual fish from each species at each location) for a total of 75 adult sport fish tissue samples. The three adult sport fish species were also collected in previous years. Legal size fish were targeted, with a maximum size identified to try to restrict the variability of size on mercury concentration; 305 to 500 mm total length for smallmouth bass, 200 to 350 mm total length for brown bullhead, and 380 mm to 575 mm total length for walleye. Three walleye that were captured exceeded the targeted size range but were retained because they would not have survived capture.

A pectoral spine from each adult brown bullhead and otoliths (small ear bones) from each smallmouth bass and walleye were collected to estimate fish age. Total length and weight of each adult fish sample for tissue chemical analyses were recorded as well.

Prey fish samples collected for tissue chemical analyses included fish from the topminnow, silversides, and shad families (Fundulidae, Atherinidae, Clupeidae). Species of prey fish were determined based on availability and included 21 banded killifish (*Fundulus diaphanus*) composites, 3 brook silversides (*Labidesthes sicculus*) composites, 1 gizzard shad (*Dorosoma cepedianum*) composite, and 15 alewife (*Alosa pseudoharengus*) composites. Alewife and gizzard shad were collected by gill netting at the eight prey fish locations (2 composites per location) in mid-June 2012, because alewife move into shallower waters during the spring and early summer allowing for easier capture at that time. The remaining prey fish composites were collected by seining at each of the eight locations (three composites per location), for a total of 24 composite samples submitted for mercury analysis. Composite samples included 10 to 15 prey fish per sample, depending on weights of individual fish.

Fish population and community composition were assessed again in 2012 as part of the Onondaga Lake fish monitoring effort. In addition to the smaller-mesh gill net used during community surveys, a larger-sized gill net was used to better understand lake sturgeon abundance and distribution. Community sampling was conducted with 5.9-inch stretch mesh netting, and sturgeon gill netting was conducted with an eight-panel experimental gill net with two panels each of 6-, 8-, 10-, and 12-inch stretch mesh in sequence for two series. Captured sturgeon were measured for total length in mm, weighed in grams, tagged with an individually marked Carline dangler tag and a passive integrated transponder (PIT) tag, and the basal portion of the pelvic fin ray was removed for age estimation. Double tagging was conducted to minimize the loss of information due to tag loss.

Distributions of adult sport fish were assessed monthly from May through October at 10 locations around the lake using gill and trap netting to determine overall community structure (Figure 2). The trap net location in SMU 2 was only sampled in May and June, because that location became inaccessible when dredging started in that area of the lake.

Sampling using electroshocking equipment on a boat was conducted in June to estimate population density of several species. Individual largemouth bass, pumpkinseed, and bluegill sunfish were measured for total length (mm), marked with a fin clip (for smaller fish) or uniquely numbered t-bar anchor floy tag (for larger fish), and examined for visible marks. Sampling using electroshocking was condensed in 2012 to four events over a two-week period in an attempt to get a more rigorous population estimate, which was different from the monthly sampling conducted in 2008 through 2011. Population estimates for largemouth bass, pumpkinseed sunfish, and bluegill sunfish were calculated using the modified Schnabel estimator (Ricker, 1975), as described in the Book 2 Work Plan for 2008 (Parsons, Exponent, and QEA, 2008). Sample size was not sufficient to conduct smallmouth bass population estimates. These species were assessed based on their dominance over the years in the lake and the likelihood of obtaining enough samples to calculate a population estimate.

2.2 ZOOPLANKTON SAMPLING

Zooplankton samples were collected at South Deep at a frequency ranging from weekly to monthly from June 11 to November 19, 2012. UFI also attempted to collect samples of large *Daphnia* zooplankton (at least 1 millimeter in length); however, similar to 2010 and 2011, quantities of *Daphnia* large enough for chemical analysis were not found during any of the 2012 zooplankton sampling events.

Zooplankton community composition was not assessed in 2012.

2.3 ANALYTICAL WORK SCOPE

Fillet samples (NYSDEC standard fish fillet based on NYSDEC 2000; skin-on except for brown bullhead) were collected from each adult sport fish for mercury analysis. In addition to being analyzed for mercury, a subset of adult sport fish fillet samples (12 per species for a total of 36 samples) were analyzed for polychlorinated biphenyl (PCB) aroclors, dichlorodiphenyl trichlorethane (DDT) and metabolites, hexachlorobenzene, and lipids. Dioxins/furans were also analyzed in five fillet samples from each of the species of adult sport fish for a total of 15 samples. Samples selected for analysis of PCBs, DDT and its metabolites, hexachlorobenzene, lipid content and dioxins/furans were representative of the various locations in the lake and were similar to samples selected annually since 2008 for chemical analyses.

Prey fish samples consisted of 40 composite samples that were analyzed for mercury. Ten composite samples also were analyzed for PCBs, DDT and metabolites, hexachlorobenzene, and lipids.

Zooplankton samples collected at South Deep were analyzed for total mercury and methylmercury.

SECTION 3

DATA MANAGEMENT AND VALIDATION SUMMARY

3.1 DATABASE

Validated results from each of the 2012 tissue monitoring efforts have been stored and accounted for in Honeywell's Locus Focus data management system for Onondaga Lake.

3.2 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

Sample identification, QA/QC procedures, sample collection, data entry, and data validation were conducted in accordance with the three agency-approved work plan addenda. Verification of sampling information and chemical data occurred at several levels during the field and laboratory work. Data verification included checking procedures for compliance with the project plan, correctness of protocols used in the field and at the laboratory, comparability of the data collection and analysis procedures, and completeness of the data set and supporting documentation.

TestAmerica Laboratories located in Pittsburgh, PA; North Canton, OH; and Knoxville, TN performed the 2012 tissue monitoring laboratory analyses on behalf of Honeywell. TestAmerica's laboratory in North Canton, Ohio conducted the analyses of zooplankton for low-level mercury and low-level methylmercury. TestAmerica's laboratory in Knoxville, Tennessee conducted the analyses of fish samples for dioxins and furans. Other analyses of fish samples were performed by TestAmerica in their Pittsburgh, PA laboratory.

3.3 DATA VALIDATION

Chemical analytical data generated by TestAmerica were reviewed and validated by Parsons for usability in accordance with data validation procedures described in the Data Usability and Summary Report (DUSR) that is presented as Appendix A to this report.

SECTION 4

DATA ASSESSMENT

4.1 FISH TISSUE CHEMICAL RESULTS FOR 2012

Mercury was detected in each of the 75 samples from adult sport fish fillets (0.19 to 3.2 milligram per kilogram or mg/kg [approximately the same as one part per million]), and in each of the 40 whole-body prey fish composite samples (0.027 to 0.61 mg/kg) (Table 3). Mercury concentration versus age in adult sport fish was evaluated to assess trends with age. Mercury concentration tends to increase with age in smallmouth bass and walleye, while no trend is apparent for brown bullhead (Figure 3).

PCB aroclors were detected in each of the 12 of the smallmouth bass, in each of the 12 walleye samples, in 11 of the 12 brown bullhead samples, and in each of the 10 of the prey fish composite samples collected in 2012 that were analyzed for organic compounds. PCB aroclors were detected in 2012 fish tissue samples at concentrations ranging from 0.097 to 1.7 mg/kg in smallmouth bass; 0.51 to 2.7 mg/kg in walleye; non-detect to 0.58 mg/kg in brown bullhead and 0.026 to 0.66 mg/kg in prey fish composites (Table 3).

DDT and metabolites were detected in each of the 12 of the smallmouth bass, walleye, and brown bullhead adult sport fish fillet samples and in each of the 10 of the prey fish composite samples collected in 2012 that were analyzed for organic compounds. DDT and metabolites were detected in 2012 fish tissue samples at concentrations ranging from 0.005 to 0.10 mg/kg in smallmouth bass, 0.026 to 0.13 mg/kg in walleye, 0.002 to 0.014 mg/kg in brown bullhead and 0.004 to 0.028 mg/kg in prey fish composites (Table 3).

Hexachlorobenzene was detected in each of the 12 of the smallmouth bass, in each of the 12 walleye, in 11 of the 12 brown bullhead adult sport fish fillet samples and in 7 of the 10 prey fish composite samples collected in 2012 that were analyzed for organic compounds. Hexachlorobenzene was detected in 2012 fish tissue samples at concentrations ranging from 0.001 to 0.010 mg/kg in smallmouth bass, 0.006 to 0.024 mg/kg in walleye, 0.001 to 0.005 mg/kg in brown bullhead, and 0.0003 to 0.011 mg/kg in prey fish composites (Table 3).

Lipid contents in 2012 fish tissue samples ranged from 0.20 to 3.7 percent in smallmouth bass fillets, 1.2 to 5.1 percent in walleye fillets, and 0.097 to 1.3 percent in brown bullhead fillets and 0.79 to 5.2 percent in prey fish composites (Table 3).

Dioxins and furans were detected in each of the five smallmouth bass, walleye, and brown bullhead adult sport fish fillet samples collected in 2012 that were analyzed for dioxins. Detections of dioxins and furans are reported in Table 4 as toxicity equivalent quotients on a nanogram per kilogram basis. One ng/kg is the same as one part per trillion or 0.000001 part per million.

4.2 FISH COMMUNITY MONITORING RESULTS FOR 2012

4.2.1 Fish Community Assessment

Fish representing 40 species were captured or observed in Onondaga Lake during fish community sampling at 10 locations from May through October of 2012. Fish representing 35 species were captured with trapnets, 17 species with gill nets, 7 species with a boat electroshocker, and 19 species with seines (Table 5).

During trap net sampling, nets were set at each location once per month during the late afternoon/evening and checked the following morning. Trap net locations were sampled from May through October except at the Route 690 location where sampling was conducted in May and June. A total of 3,373 fish representing 35 species were captured during 57 nights of trap netting during 2012 (Table 6). The 2012 fish community from trap net sampling was dominated by bluegill (20 percent of the total catch). Banded killifish made up 16 percent of the community from trap net sampling followed by pumpkinseed (13 percent), and brown bullhead (7 percent). Seven species made up between one and six percent of the catch and 21 species contributed less than one percent of the total catch. The number of species captured with trap nets in 2012 at each location varied from 15 species at the Rte. 690 location (sampled for only two months) to 24 species at the Metro location (Table 6).

Data were collected from fifty-two gill nets that were each set for approximately two hours between May 1 and October 18, 2012. These 52 gill nets were set on three to six different dates at 10 different locations throughout Onondaga Lake (Table 7). A total of 349 fish and 17 species were captured during sampling (Table 8). The most abundant fish captured was walleye (33 percent of the total catch), followed by gizzard shad (17 percent), common carp (15 percent), and channel catfish (15 percent). In addition, seven lake sturgeons were captured during regular gill netting as follows: three from 690 Point, and one each from Parsons, Marina, PHM, and Hiawatha Point. The number of species per location varied between five species at both the Marina and Harbor Brook locations and 10 species at both the Outlet and Iron Bridge locations.

Thirty-nine lake sturgeon gill nets were set at eight locations from May 8 through October 26. They were fished for an average of four hours per net. Twenty-two sturgeon were captured with a catch per unit of effort (CPUE) (fish per hour) of approximately 0.15 (excluding the seven sturgeon captured during community sampling). High temperatures in July resulted in the mortality of two sturgeon, one on July 17 and the other on July 18. Following the first mortality, sampling was reduced to shorter sets and then completely suspended following the second mortality through the month of August (until temperatures were below 25°C). Both of the dead sturgeon were sent to Dr. Dawn Dittman at US Geological Survey's Tunison lab in Cortland, NY. Sixteen lake sturgeon were tagged in 2012 with Carlin dangle tags (Table 9). Mean total length of the 22 sturgeon was 54.5 in. (1384 mm) with a range from 41 to 68.3 in. (1042 mm to 1735 mm). Weights were not collected for each fish because some of the fish surpassed the maximum weight limit (20 kg) of the scale that was used. Eleven lake sturgeon caught with lake sturgeon gill nets were weighed and weights ranging from 17.6 and 53.4 pounds (8 to 24.2 kg) were recorded. At least one sturgeon was collected at each sampling location during targeted sampling with six collected at the marina, three each collected at Hiawatha Point, Iron Bridge,

PARSONS

Ninemile Creek, and Wastebed 1-8 locations, two collected at the Outlet location, and one each collected at the Parsons and the Permanent Habitat Module (PHM) locations (Table 9).

Seining was conducted during the week of August 13 at eight locations (Figure 1 and Table 10). Two thousand six hundred and eighty five (2,685) fish were captured from 20 species. Fish catch was dominated by banded killifish (55 percent of the total catch) and largemouth bass (22 percent), pumpkinseed (8.5 percent), round goby (5.7 percent), bluegill (2.8 percent), and yellow perch (1.2 percent) made up the majority of the other species captured. The other 13 species captured each contributed one percent or less of the total catch and three percent of the total catch combined. The number of species captured at each location ranged from five at the Wastebeds 1 through 8 location to 14 at the PHM location (Table 10).

4.2.2 Fish Population Assessment for Adult Pumpkinseed, Bluegill and Largemouth Bass

A total of 929 pumpkinseed with total lengths of 100 mm [3.9 in.] or more were captured and marked during four electroshocking sampling events in June 2012 with 10 recaptures. The lakewide pumpkinseed population for 2012 was estimated at 28,655 with a 95 percent confidence interval of 18,328 to 65,641 fish.

A total of 833 bluegill with total lengths of 100 mm [3.9 in.] or more were captured and marked during four sampling events in June 2012 with six recaptures. The lakewide bluegill population for 2012 was estimated at 36,415 with a 95 percent confidence interval of 21,600 to 115,920 fish.

A total of 286 largemouth bass with total lengths of 300 mm [11.8 in.] or more were captured and marked during four sampling events in June 2012 with 14 recaptures. The lakewide largemouth bass population for 2012 was estimated at 1,930 with a 95 percent confidence interval of 1,297 to 3,777 fish.

4.3 ZOOPLANKTON MERCURY RESULTS FOR 2012

Table 11 and Figure 4A present total mercury and methylmercury concentrations measured in zooplankton collected at South Deep in 2012. Methylmercury as a percentage of total mercury in the 2012 zooplankton samples is presented in Figure 4B. Figures 4A and 4B do not include results from September 12, 2012, because mercury results from September 12 show a concentration of methylmercury that is relatively small but higher than the concentration of total mercury.

The highest total mercury concentration observed in 2012 in zooplankton was 0.27 milligrams per kilogram (or parts per million) (mg/kg) on a wet-weight basis observed on September 4 more than a month prior to fall turnover. The highest methylmercury concentrations observed in 2012 in zooplankton was 0.014 mg/kg on August 6. The highest portion of methylmercury observed in 2012 as a percentage of total mercury was 21 percent prior to the start of fall turnover and ranged from 20 to 39 percent following fall turnover.

TABLE 1

**ONONDAGA LAKE FISH TISSUE, HABITAT AND BIOLOGICAL MONITORING
OBJECTIVES, PROGRAM ELEMENTS, AND DATA USES FOR 2012**

Element	Objective	Data Uses
Adult sport fish and prey fish tissue sampling and analysis	Establish chemical and physical conditions	Provide basis for comparing concentrations of mercury and organic parameters of interest to prior year results and in the long term to determine when fish tissue target concentrations for human health and wildlife protection are met.
Other biota sampling ^a	Provide additional data for future understanding of remedy effectiveness in achieving PRGs and provide habitat-related baseline information	Assess zooplankton mercury and fish community - fish population that may contribute to variability in fish mercury concentrations. Fish community - fish population data also provide additional baseline prior to re-establishing habitat following dredging and capping.

Adapted from Table ES.1 of draft Onondaga Lake Monitoring and Maintenance Scoping Document (Parsons, Anchor QEA and Exponent, 2012a)

^aOther than chemical analysis of adult sport fish and prey fish (i.e zooplankton mercury and fish community - fish populations)

PRG - preliminary remediation goal

TABLE 2

SUMMARY OF TISSUE AND BIOLOGICAL MONITORING WORK COMPLETED DURING 2012

WORK PLAN AND MEDIA	LOCATIONS	PRIMARY ACTIVITY (May through October)
Zooplankton	South Deep	Monthly to weekly sampling and analyses for total mercury and methylmercury.
Adult Sport Fish	SMUs 2 through 7 (8 locations)	Collected and analyzed for chemical parameters of interest a total of 75 adult sport fish during June (25 smallmouth bass, 25 walleye, and 25 brown bullhead). Collected fish lakewide with trap nets, gill nets and seines to quantify fish community composition. Collected pumpkinseed, bluegill and largemouth bass lakewide to assess fish populations.
Prey (forage) Fish	SMUs 2 through 7 (same 8 locations as for adult sport fish)	Collected and analyzed three composites of prey fish in August from each of eight locations (24 composites), a total of 15 composites of alewife collected in June, and one composite of gizzard shad also collected in June (40 prey fish composites total).

Note: Fall turnover in Onondaga Lake during 2012 occurred on or about October 22.

Table 3
Summary of 2012 Fish Tissue Chemical Concentrations Measured in Onondaga Lake (wet weight basis)

Parameter	Prep	Species	Sample Size	Number of Detections	Arithmetic Mean ¹	Min ¹	Max ¹	Standard Deviation ²	Standard Error ³
Mercury (mg/kg) ⁴	whole body	prey fish ⁵	40	40	0.217	0.027	0.610	0.161	0.026

¹ U means not detected. Minimum and maximum non-detects reported at the reporting limit.

² Standard deviation is an estimate of the variability of the data points used to calculate the mean (e.g., approximately 68% of the data points will be within plus or minus one standard deviation of the sample mean and 95% will be within two standard deviations).

³ Standard error is an estimate of how close the calculated mean is likely to be to the true population mean (e.g., there is approximately a 68% chance that the actual population mean falls within plus or minus one standard error of the sample mean and a 95% chance that it fall within two standard deviations).

⁴ For individual non-detects, 1/2 the reporting limit was used in calculations.

⁵ The average, minimum, and maximum mercury concentrations for alewife (a prey fish subset) were 0.145, 0.072, and 0.21 mg/kg respectively. Alewife made up 15 of the 40 prey fish composite samples collected and analyzed.

Notes:

dl - detection limit

TEQ - toxicity equivalent quotient calculated using human and mammalian toxic equivalency factors (TEFs) from Van den Berg et al. (2006)

Fish Types:

BB - Brown Bullhead

SMB - Smallmouth Bass

WALL - Walleye

Table 5

Summary of Species Collected By Gear Type For Onondaga Lake Fish Community Assessment:
May - October 2012

Common Name	Scientific Name	Trap Net	Gill Net	Electro-shocker	Seining
Alewife	<i>Alosa pseudoharengus</i>	x	x		
Banded killifish	<i>Fundulus diaphanus</i>	x			x
Black bullhead	<i>Ameriurus melas</i>	x			
Black crappie	<i>Pomoxis nigromaculatus</i>	x			
Bluegill	<i>Lepomis macrochirus</i>	x		x	x
Bluntnose minnow	<i>Pimephales notatus</i>	x			x
Bowfin	<i>Amia calva</i>	x	x		
Brook silverside	<i>Labidesthes sicculus</i>	x			x
Brown bullhead	<i>Ameiurus nebulosus</i>	x	x		x
Channel catfish	<i>Ictalurus punctatus</i>	x	x		
Common carp	<i>Cyprinus carpio</i>	x	x		x
Common shiner	<i>Luxilus cornutus</i>	x			
Creek chub	<i>Semotilus atromaculatus</i>	x			x
Emerald shiner	<i>Notropis atherinoides</i>	x			x
Fathead minnow	<i>Pimephales promelas</i>	x			
Freshwater drum	<i>Aplodinotus grunniens</i>	x	x		
Gizzard shad	<i>Dorosoma cepedianum</i>	x	x		
Golden shiner	<i>Notemigonus crysoleucas</i>	x			x
Goldfish	<i>Carassius auratus</i>	x			
Green sunfish	<i>Lepomis cyanellus</i>	x			x
Lake sturgeon	<i>Acipenser fulvescens</i>		x		
Largemouth bass	<i>Micropterus salmoides</i>	x		x	x
Longnose gar	<i>Lepisosteus osseus</i>	x	x		
Northern pike	<i>Esox lucius</i>	x	x	x	
Pumpkinseed	<i>Lepomis gibbosus</i>	x		x	x
Quillback carpsucker	<i>Carpionodes cyprinus</i>		x		
Rockbass	<i>Ambloplites rupestris</i>	x			x
Round goby	<i>Neogobius melanostomus</i>	x			x
Rudd	<i>Scardinius erythrophthalmus</i>	x	x		
Shorthead redhorse	<i>Moxostoma macrolepidotum</i>	x	x		
Silver redhorse	<i>Moxostoma anisurum</i>	x			
Smallmouth bass	<i>Micropterus dolomieu</i>	x	x	x	x
Tadpole madtom	<i>Noturus gyrinus</i>				x
Tessellated darter	<i>Etheostoma olmstedii</i>	x			x
Tiger muskellunge	<i>Esox lucius x Esox masquinongi</i>			x	
Walleye	<i>Sander vitreus</i>		x	x	
White perch	<i>Morone americana</i>	x	x		
White sucker	<i>Catostomus commersoni</i>	x	x		
Yellow bullhead	<i>Ameiurus natalis</i>	x			x
Yellow perch	<i>Perca flavescens</i>	x			x

SAMPLES

SECTION A1

DATA USABILITY SUMMARY

Fish tissue samples were collected as part of the 2012 remedial goal monitoring efforts for Onondaga Lake from June 14, 2012 to August 9, 2012, and zooplankton samples were collected from June 11 through November 19, 2012. Analytical results from these samples were validated and reviewed by Parsons for usability with respect to the following requirements:

- Onondaga Lake Tissue Monitoring Work Plan for 2012 (Parsons, Anchor QEA and Exponent, 2012)
- Draft Onondaga Lake Remedial Goal and Construction Water Quality Monitoring Quality Assurance Project Plan (QAPP) (Parsons, Anchor QEA and UFI, 2012)
- USEPA Region II Standard Operating Procedures (SOPs) for organic and inorganic data review (USEPA, see page A2-1 for citations)

Fish samples were collected by Anchor QEA with some assistance from the State University of New York College of Environmental Science and Forestry and Onondaga County. The zooplankton samples were collected by Upstate Freshwater Institute (UFI).

Analytical laboratories for this project were Test America Laboratories (TAL) located in Pittsburgh, PA; Knoxville, TN; and North Canton, OH. These laboratories are certified by the State of New York to conduct laboratory analyses for this project through the National Environmental Laboratory Accreditation Conference (NELAC) and New York Department of Health (NYSDOH) Environmental Laboratory Accreditation Program (ELAP).

A1.1 LABORATORY DATA PACKAGES

Laboratory data package turnaround time, defined as the time from sample receipt by the laboratory to receipt of the analytical data packages by Parsons, was 10 to 101 days for the samples.

Data packages received from the laboratories were paginated, complete, and overall were of good quality. Comments on specific quality control (QC) and other requirements are discussed in detail in the attached data validation report which is summarized in Section A2.

A1.2 SAMPLING AND CHAIN-OF-CUSTODY

Samples were collected, properly preserved, shipped under a COC record, and received at the laboratories within one day of sampling. All samples were received intact and in good condition at TAL.

A1.3 LABORATORY ANALYTICAL METHODS

A total of 75 adult sport fish fillet (tissue) samples and 40 composited prey fish samples collected from Onondaga Lake in 2012 were analyzed for mercury. In addition, 36 of the 75

PARSONS

adult fish tissue samples and 10 of the prey fish samples collected from Onondaga Lake in 2012 were analyzed for hexachlorobenzene, 4,4'-DDT and metabolites, polychlorinated biphenyls (PCBs), and percent lipids. Dioxins and furans were analyzed in 15 of the 75 adult sport fish fillet samples. A total of 16 zooplankton samples were collected from Onondaga Lake in 2012 and analyzed for low level mercury and methyl mercury. Summaries of deviations from the Work Plan, QAPP, or USEPA Region II SOPs concerning these laboratory analyses are presented in Subsections A1.3.1 through A1.3.5. The data qualifications resulting from the data validation review and statements on the laboratory analytical precision, accuracy, representativeness, completeness, and comparability (PARCC) are discussed for each analytical method by matrix in Section A2. The laboratory data were reviewed and may be qualified with the following validation flags:

- "U" - not detected at the value given
- "UJ" - estimated and not detected at the value given
- "J" - estimated at the value given
- "N" - presumptive evidence at the value given
- "R" - unusable value

The validated laboratory data were tabulated and are presented in Attachment A.

A1.3.1 Mercury, Low Level Mercury, and Methyl Mercury Analysis

Fish samples collected from Onondaga Lake in 2012 were analyzed by TAL's Pittsburgh, PA laboratory for mercury using the USEPA SW846 7471A analytical method. Zooplankton samples collected from Onondaga Lake in 2012 were analyzed by TAL's North Canton, OH laboratory for low level mercury using the USEPA 1631E analytical method; and methyl mercury using the USEPA 1630 analytical method. Certain reported results for the mercury and low level mercury samples were considered estimated based upon matrix spike/matrix spike duplicate (MS/MSD) recoveries and laboratory control sample (LCS) recoveries. The reported mercury, low level mercury, and methyl mercury analytical results were considered 100% complete (i.e., usable) for the data presented by TAL. PARCC requirements were met.

A1.3.2 PCB Analysis

Fish samples collected from Onondaga Lake in 2012 were analyzed by TAL's Pittsburgh, PA laboratory for PCB aroclors using the USEPA SW846 8082 analytical method. The reported results for these samples did not require qualification resulting from data validation. The reported PCB analytical results were considered 100% complete with all data considered usable and valid as reported by TAL. PARCC requirements were met.

A1.3.3 Hexachlorobenzene, 4,4'-DDT, and Metabolites Analysis

Fish samples collected from Onondaga Lake in 2012 were analyzed by TAL's Pittsburgh, PA laboratory for hexachlorobenzene, 4,4'-DDT, and metabolites using the USEPA SW846 8081A analytical method. Certain reported results for these samples were qualified as estimated

based upon sample surrogate recoveries, MS/MSD recoveries, and sample result identifications. The reported analytical results for these samples were considered 100% complete with all data considered usable and valid as reported by TAL. PARCC requirements were met.

A1.3.4 Dioxins and Furans

Fish samples collected from Onondaga Lake in 2012 were analyzed by TAL's Knoxville, TN laboratory for dioxins and furans using the USEPA SW846 8290 analytical method. Certain reported results for these samples were qualified as estimated based upon laboratory control sample recoveries. The reported analytical results for these samples were considered 100% complete with all data considered usable and valid as reported by TAL. PARCC requirements were met.

A1.3.5 Percent Lipids

Fish samples collected from the site were analyzed by TAL's Pittsburgh, PA laboratory for percent lipids using the TAL SOP analytical method. The reported results for these samples did not require qualification resulting from data validation. The reported analytical results for these samples were considered 100% complete with all data considered usable and valid as reported by TAL. PARCC requirements were met.

SECTION A2**DATA VALIDATION REPORT****A2.1 FISH**

Data review has been completed for data packages generated by TAL containing fish samples collected from the site. The specific samples contained in these data packages, the analyses performed, and validated laboratory data are tabulated and presented in Attachment A-1. All of these samples were properly preserved, shipped under a COC record, and received intact by the analytical laboratory.

Data validation was performed for all samples in accordance with the project work plan and QAPP as well as the USEPA Region II SOPs HW-44, Revision 1 “Data Validation SOP of Organochlorine Pesticides by Gas Chromatography SW-846 Method 8081B”; HW-45, Revision 1 “Data Validation SOP of Organic Analysis of PCBs by Gas Chromatography SW-846 Method 8082A; HW-2, Revision 13 “Evaluation of Metals Data for the CLP Program”; and HW-19, Revision 1 “USEPA Region II Data Validation SOP for SW-846 Method 8290 Polychlorinated Dibenzodioxins (PCDDs) and Polychlorinated Dibenzofurans (PCDFs) By High-Resolution Gas Chromatography/High-Resolution Mass Spectrometry (HRGC/HRMS)”. This data validation and usability report is presented by analysis type.

A2.1.1 Mercury

The following items were reviewed for compliancy in the mercury analysis:

- Custody documentation
- Holding times
- Initial and continuing calibration verifications
- Initial and continuing calibration, and laboratory preparation blank contamination
- Matrix spike/matrix spike duplicate (MS/MSD) recoveries
- Laboratory duplicate precision
- Laboratory control sample (LCS) recoveries
- Interference check sample recoveries
- Sample result verification and identification
- Quantitation limits
- Data completeness

These items were considered compliant and acceptable in accordance with the validation protocols with the exception of MS/MSD recoveries as discussed below.

MS/MSD Recoveries

All MS/MSD recoveries were considered acceptable and within the 75-125%R QC limit for designated spiked project samples with the exception of the low MSD mercury recovery (58%R) associated with fish samples collected on 6/14/12; and the high MSD mercury recovery (130%R) associated with fish samples collected on 6/21/12. Therefore, mercury results for those samples where the MSD recovery fell below the QC limit were considered estimated, possibly biased low, with positive results qualified “J” and nondetected results qualified “UJ” for the affected samples. The positive mercury results for those samples where the MSD recovery exceeded the QC limit were considered estimated, possibly biased high, and qualified “J” for the affected samples.

Usability

All mercury sample results for the fish samples were considered usable following data validation.

Summary

The quality assurance objectives for measurement data included considerations for precision, accuracy, representativeness, completeness, and comparability. The mercury data presented by TAL were 100% complete (i.e., usable). The validated mercury laboratory data are tabulated and presented in Attachment A-1.

A2.1.2 PCBs

The following items were reviewed for compliancy in the PCB analysis:

- Custody documentation
- Holding times
- Surrogate recoveries
- Matrix spike/matrix spike duplicate (MS/MSD) precision and accuracy
- Laboratory control sample (LCS) recoveries
- Laboratory method blank contamination
- Initial calibrations
- Verification calibrations
- Chromatogram quality
- Sample result verification and identification
- Quantitation limits
- Data completeness

These items were considered compliant and acceptable in accordance with the validation protocols.

Usability

All PCB sample results for the fish samples were considered usable following data validation.

Summary

The quality assurance objectives for measurement data included considerations for precision, accuracy, representativeness, completeness, and comparability. The PCB data presented by TAL were 100% complete with all data considered usable and valid. The validated data are tabulated and presented in Attachment A-1.

A2.1.3 Hexachlorobenzene, 4,4'-DDT, and Metabolites

The following items were reviewed for compliancy in the hexachlorobenzene, 4,4'-DDT, and metabolites analysis:

- Custody documentation
- Holding times
- Surrogate recoveries
- Matrix spike/matrix spike duplicate (MS/MSD) precision and accuracy
- Laboratory control sample (LCS) recoveries
- Laboratory method blank contamination
- Initial calibrations
- Verification calibrations
- 4,4'-DDT breakdown
- Chromatogram quality
- Sample result verification and identification
- Quantitation limits
- Data completeness

These items were considered compliant and acceptable in accordance with the validation protocols with the exceptions of surrogate recoveries, MS/MSD precision and accuracy, and sample result identifications as discussed below.

Surrogate Recoveries

All sample surrogate recoveries were considered acceptable and within QC limits with the exception of the low tetrachloro-m-xylene recovery (QC limit 45-130%R) on both the primary quantitation column and secondary confirmation column in samples OL-1803-07F (43%R,

41%R) and OL-1806-03F (42%R, 40%R); the low decachlorobiphenyl recovery (QC limit 45-130%R) on the primary quantitation column in sample OL-1803-07F (44%R); and the high decachlorobiphenyl recovery (QC limit 45-130%R) on the secondary confirmation column in samples OL-1801-05F (185%R), OL-1801-06F (133%R), OL-1802-01F (167%R), OL-1803-05F (133%R), and OL-1804-15F (154%R). Validation qualification was not required for these samples with the exception of OL-1803-07F. The positive results for this sample were considered estimated, possibly biased low, and qualified “J”.

MS/MSD Precision and Accuracy

All MS/MSD precision and accuracy measurements for spiked compounds were considered acceptable and within QC limits for designated spiked project samples with the exception of the low MS accuracy result for 4,4'-DDE (60%R; QC limit 70-133%R) during the spiked analyses of sample OL-1801-06F; the low MS/MSD accuracy results for 4,4'-DDE (39%R/13%R; QC limit 70-133%R), 4,4'-DDT (54%R/41%R; QC limit 61-126%R), and 4,4'-DDD (62%R/50%R; QC limit 70-135%R) during the spiked analyses of sample OL-1803-04F; the high MS/MSD accuracy results for 4,4'-DDE (144%R/155%R; QC limit 70-133%R) during the spiked analyses of sample OL-1804-15F; and the low MS/MSD accuracy results for 4,4'-DDE (-34%R/-9%R; QC limit 70-133%R), 4,4'-DDT (-7%R/8%R; QC limit 61-126%R), and 4,4'-DDD (50%R/63%R; QC limit 70-135%R) during the spiked analyses of sample OL-1805-02F. Validation qualification of the parent sample OL-1801-06F was not required based upon one accuracy result outside the QC limit. However, results for those compounds where MS/MSD accuracy results fell below QC limits were considered estimated, possibly biased low, with positive results qualified “J” and nondetected results qualified “UJ” for the parent sample. Positive results for those compounds where MS/MSD accuracy results exceeded the QC limit were considered estimated, possibly biased high, and qualified “J” for the parent samples.

Sample Result Identifications

Positive sample results were verified and confirmed present using dual column confirmation. The precision (%RPD) between the results on the dual columns was less than 25% with the exception of hexachlorobenzene for samples OL-1810-07 (31.5%RPD) and -10 (176.6%RPD); 4,4'-DDE for samples OL-1800-02F (38.5%RPD), -03F (45%RPD), -06F (47.8%RPD), -07F (49.4%RPD), -11F (40.4%RPD), -12F (29%RPD), OL-1802-01F (49.5%RPD), -04F (28.1%RPD), -05F (28.3%RPD), OL-1803-04F (26%RPD), -05F (28.9%RPD), -13F (33.8%RPD), -18F (27.1%RPD), OL-1804-01F (38.4%RPD), -02F (33.4%RPD), -04 (25.2%RPD), -06F (29.5%RPD), -11F (32.3%RPD), -13F (43.8%RPD), -14F (29.5%RPD), OL-1806-03F (26.8%RPD), -04F (26.3%RPD), and OL-1807-01F (25.2%RPD); 4,4'-DDT for samples OL-1800-02F (142.4%RPD), -03F (142.4%RPD), -06F (150.3%RPD), -07F (152%RPD), -09 (152.8%RPD), -11F (154.8%RPD), -12F (150.7%RPD), OL-1801-05F (150.9%RPD), -06F (151.3%RPD), -07F (148.9%RPD), OL-1802-01F (143.6%RPD), -02F (150.3%RPD), -04F (147.2%RPD), -05F (147.2%RPD), -06F (150.9%RPD), -07F

(151.6%RPD), OL-1803-04F (148.5%RPD), -05F (147.8%RPD), -07F (151.5%RPD), -11 (147.9%RPD), -13F (144.4%RPD), -18F (138.9%RPD), OL-1804-01F (146.9%RPD), -02F (152%RPD), -04 (147.4%RPD), -06F (151.2%RPD), -11F (154%RPD), -12F (139.9%RPD), -13F (140.6%RPD), -14F (159.7%RPD), -15F (159.7%RPD), -16F (167.2%RPD), OL-1805-02F (160.9%RPD), -03F (161.5%RPD), -04F (161.5%RPD), OL-1806-03F (159.2%RPD), -04F (158.7%RPD), OL-1807-01F (157%RPD), and OL-1810-05 (54.7%RPD); and 4,4'-DDD for samples OL-1800-02F (133.2%RPD), -03F (146%RPD), -06F (138.6%RPD), -07F (141.5%RPD), -09 (132.8%RPD), -11F (135.7%RPD), -12F (106.1%RPD), OL-1801-05F (145.9%RPD), -06F (144.8%RPD), -07F (139.6%RPD), OL-1802-01F (138.8%RPD), -02F (149.6%RPD), -04F (151%RPD), -05F (153.2%RPD), -06F (161.1%RPD), -07F (140.6%RPD), OL-1803-04F (143.5%RPD), -05F (155.2%RPD), -07F (146.6%RPD), -11 (113.1%RPD), -13F (135.6%RPD), -18F (138%RPD), OL-1804-01F (128.6%RPD), -02F (141.1%RPD), -04 (185.9%RPD), -06F (153%RPD), -11F (135.2%RPD), -12F (156%RPD), -13F (158%RPD), -14F (143.3%RPD), -15F (160.6%RPD), -16F (143.4%RPD), OL-1805-02F (148%RPD), -03F (153.2%RPD), -04F (152.5%RPD), OL-1806-03F (154%RPD), -04F (156.9%RPD), OL-1807-01F (159.4%RPD), OL-1810-01 (91%RPD), -05 (96.6%RPD), -07 (79%RPD), -10 (130.5%RPD), and -13 (139%RPD). These results were considered estimated and qualified "J" for the affected samples. However, for those compounds where the %RPD was greater than 90%, the results were considered estimated, tentatively identified, and qualified "JN" for the affected samples.

Usability

All hexachlorobenzene, 4,4'-DDT, and metabolite sample results for the fish samples were considered usable following data validation.

Summary

The quality assurance objectives for measurement data included considerations for precision, accuracy, representativeness, completeness, and comparability. The hexachlorobenzene, 4,4'-DDT, and metabolite data presented by TAL were 100% complete with all data considered usable and valid. The validated data are tabulated and presented in Attachment A-1.

A2.1.4 Dioxins and Furans

The following items were reviewed for compliancy in the dioxins and furans analysis:

- Custody documentation
- Holding times
- Surrogate recoveries
- Matrix spike/matrix spike duplicate (MS/MSD) precision and accuracy
- Laboratory control sample (LCS) recoveries

PARSONS

- Laboratory method blank contamination
- Initial calibrations
- Verification calibrations
- Internal standard recoveries
- Clean-up recoveries
- Sample result verification and identification
- Quantitation limits
- Data completeness

These items were considered compliant and acceptable in accordance with the validation protocols with the exception of LCS recoveries and blank contamination as discussed below.

LCS Recoveries

All LCS recoveries were considered acceptable and within QC limits for all dioxins and furans with the exception of the low LCS recovery for OCDF (62%R; QC limit 70-130%R) associated with all sport fish samples. Therefore, the OCDF results for these samples which were nondetects were considered estimated, possibly biased low, and qualified “UJ”.

Blank Contamination

The laboratory method blank associated with all sport fish samples contained OCDD and OCDF below the reporting limit at concentrations of 0.66 and 0.42 pg/g, respectively. Therefore, associated sample results less than validation action concentrations were considered not detected and qualified “U” for the affected samples.

Usability

All dioxin and furan results for the sport fish samples were considered usable following data validation.

Summary

The quality assurance objectives for measurement data included considerations for precision, accuracy, representativeness, completeness, and comparability. The dioxin and furan data presented by TAL were 100% complete with all data considered usable and valid. The validated data are tabulated and presented in Attachment A-1.

A2.1.5 Percent Lipids

The following items were reviewed for compliancy in the percent lipids analysis:

- Custody documentation
- Holding times

- Laboratory blank contamination
- Laboratory duplicate precision
- Sample result verification and identification
- Quantitation limits
- Data completeness

These items were considered compliant and acceptable in accordance with the validation protocols.

Usability

All percent lipids sample results for the fish samples were considered usable following data validation.

Summary

The quality assurance objectives for measurement data included considerations for precision, accuracy, representativeness, completeness, and comparability. The percent lipids data presented by TAL were 100% complete (i.e., usable). The validated laboratory data are tabulated and presented in Attachment A-1.

A2.2 ZOOPLANKTON SAMPLES

Data review has been completed for data packages generated by TAL containing zooplankton samples collected from the site. The specific samples contained in these data packages, the analyses performed, and the validated laboratory data were tabulated and are presented in Attachment A-2. All of these samples were shipped under a COC record and received intact by the analytical laboratory.

Data validation was performed for all samples in accordance with the project work plan and QAPP as well as the USEPA Region II SOP HW-2, Revision 13 "Evaluation of Metals Data for the CLP Program". This data validation and usability report is presented by analysis type.

A2.2.1 Low Level Mercury

The following items were reviewed for compliancy in the low level mercury analysis:

- Custody documentation
- Holding times
- Initial and continuing calibration verifications
- Initial and continuing calibration, and laboratory preparation blank contamination
- Matrix spike / matrix spike duplicate (MS/MSD) recoveries
- Laboratory duplicate precision

- Laboratory control sample (LCS) recoveries
- Sample result verification and identification
- Quantitation limits
- Data completeness

These items were considered compliant and acceptable in accordance with the validation protocols with the exception of blank contamination and laboratory control sample recoveries as discussed below.

Blank Contamination

Initial and continuing calibration blanks contained low level mercury below the reporting limit associated with project samples at a concentration ranging 0.128 – 0.269 ng/L. Validation qualification of the project samples was not required since the samples were not affected by the contamination detected in these blanks.

LCS Recoveries

All LCS recoveries were considered acceptable and within the 65-130%R QC limit for low level mercury with the exception of the low LCS recovery (20%R) associated with samples OL-1771-01, OL-1775-01, and OL-1779-01. Therefore, the positive low level mercury results for these samples were considered estimated, possibly biased low, and qualified “J”.

Usability

All low level mercury sample results for the zooplankton samples were considered usable following data validation.

Summary

The quality assurance objectives for measurement data included considerations for precision, accuracy, representativeness, completeness, and comparability. The low level mercury data presented by TAL were 100% complete (i.e., usable). The validated low level mercury laboratory data are tabulated and presented in Attachment A-2.

A2.2.2 Methyl Mercury

The following items were reviewed for compliancy in the methyl mercury analysis:

- Custody documentation
- Holding times
- Surrogate recoveries
- Initial and continuing calibration verifications
- Initial and continuing calibration, and laboratory preparation blank contamination
- Matrix spike / matrix spike duplicate (MS/MSD) recoveries

PARSONS

- Laboratory duplicate precision
- Laboratory control sample (LCS) recoveries
- Sample result verification and identification
- Quantitation limits
- Data completeness

These items were considered compliant and acceptable in accordance with the validation protocols with the exception of blank contamination as discussed below.

Blank Contamination

Initial and continuing calibration blanks contained methyl mercury below the reporting limit associated with project samples at a concentration ranging 0.0105 – 0.0315 ng/L. The methyl mercury sample results did not require qualification since sample concentrations were not affected by the contamination in these blanks.

Usability

All methyl mercury sample results for the zooplankton samples were considered usable following data validation.

Summary

The quality assurance objectives for measurement data included considerations for precision, accuracy, representativeness, completeness, and comparability. The methyl mercury data presented by TAL were 100% complete (i.e., usable). The validated methyl mercury laboratory data are tabulated and presented in Attachment A-2.
