

APPENDIX N

BSQV ANALYSIS

The bioaccumulation-based sediment quality value (BSQV) for total mercury was developed in the Onondaga Lake Feasibility Study (Parsons, 2004) in consideration of the potential for methylmercury bioaccumulation from sediment to fish (NYSDEC and USEPA, 2005). The mercury BSQV of 0.8 mg/kg (part per million) is to be met on an area-wide basis by the year 2027, which is 10 years following the remediation of upland sources, dredging and/or isolation capping of littoral sediment, and initial thin-layer capping in the profundal zone. Because the BSQV applies to surface sediment, results of natural recovery modeling presented in Appendix N have been incorporated into this BSQV analysis. This appendix presents details of the BSQV analysis of lake surface sediment mercury data including a series of spreadsheets that surface sediment mercury concentrations summarized in Table N.1 and also two figures presented as Figures N.1 and N.2 that illustrate how available surface sediment mercury data were applied to develop this analysis of BSQV.

Area-weighted average surface sediment mercury concentrations were calculated for five areas of the lake: the North Basin, Ninemile Creek Outlet Area, Saddle, South Basin and South Corner based on area Theissan polygons with border lines equidistant from the adjacent sample location (see Figures N.1 and N.2 for locations, concentrations and polygons). Sediment data available as of May 2010 from the littoral zone (labeled as 'L' in the last column of the spreadsheets) and from the profundal zone or SMU 8 (labeled as 'P' in the last column) are included in this analysis. Surface-weighted average surface sediment mercury concentrations in the littoral zone are assumed to remain constant over time and range from 0.12 to 0.86 mg/kg outside the remediation areas. Sediment mercury concentrations in the surface layer of the future engineered cap was assigned for this analysis a concentration of 0.1 mg/kg based on cap material mercury concentrations in fill materials placed to date at other Syracuse area remediation projects such as LCP. Surface-weighted average surface sediment mercury concentrations in the profundal zone (SMU 8) continue to decline over time due to ongoing natural recovery documented in Appendix M. By the end of the 10-year MNR monitoring period in the year 2027, surface sediment mercury concentrations in SMU 8 will be much lower than concentrations shown in the Appendix N spreadsheets.

The total weighted average surface sediment mercury concentrations for each of the five Onondaga Lake sub-areas are predicted to be significantly less than the BSQV of 0.8 mg/kg by the year 2027 as presented below and in Table N.1:

North Basin area	0.61 mg/kg
Ninemile Creek Outlet area	0.38 mg/kg
Saddle area	0.49 mg/kg
South Basin area	0.49 mg/kg
South Corner area	0.34 mg/kg
Lakewide average	0.46 mg/kg

Average mercury concentrations higher than 0.1 mg/kg in the surface layer of the engineered cap in any of the remediation areas would still result in predicted surface sediment mercury concentrations below the BSQV in any of the five areas.

The mercury BSQV is predicted to be met by the end of the 10-year MNR monitoring period (i.e., the year 2027) without additional thin-layer capping. If future monitoring and modeling predict that the mercury BSQV for the year 2027 will exceed 0.8 mg/kg for any areas of the lake assessed herein, then contingency actions will be implemented at that time as appropriate.

TABLES

**Table N.1
Surface-Weighted Average Sediment Mercury Concentrations in Onondaga Lake**

	Area Average Surface Sediment Mercury Concentration (mg/kg)					Total Area (square meters)	Total Area (acres)
	Profundal Zone (Existing)	Littoral Zone Following Dredging and Capping	Total Weighted Average for the Littoral Zone following Dredging and Capping and the Profundal Zone (Existing) ¹	Total Weighted Average for the Littoral Zone following Dredging and Capping and the Profundal Zone by the Year 2027 ² Based on Natural Recovery			
North Basin	1.07	0.86	1.03	0.61	3,474,557.11	871.37	
Ninemile Creek Outlet "Saddle"	1.82	0.24	1.04	0.38	898,268.79	221.97	
South Basin	1.44	0.44	1.12	0.49	966,706.89	238.88	
South Corner	3.05	0.41	2.50	0.49	3,360,882.74	830.49	
	2.14	0.12	1.15	0.34	1,574,028.44	388.95	
Total Area-Based Average	1.91	0.41	1.37	0.46	10,274,443.97	2,551.64	

(1) Total = area weighted average for littoral zone plus profundal zone without future benefits expected from natural recovery concentrations predicted based on future natural recovery as modeled (see Appendix M).

(2) These concentrations incorporate predictions for future natural recovery presented in Appendix M.

- NYSDEC Demarcation for SMU 8
- OL-VC-80023
2.2 (0-0.3) Sediment Sample Location ID with mercury result and depth interval.

NOTES

1. The 30-foot water depth contour is the boundary between the littoral zone and SMU 8.
2. Water depth is based on average lake elevation of 362.82 feet.
3. O.X is total mercury concentration in mg/kg (ppm). O.Y is the sample bottom depth in feet.
4. RI results are included for the littoral zone but not for SMU 8 because of natural recovery ongoing in SMU 8.
