JANUARY 2010
1.0 INTRODUCTION

This summary report describes the results of direct shear interface testing for the geotextile tubes and liner materials to be used in construction of the Sediment Consolidation Area (SCA). Interface direct shear testing was performed on the geotextile tube material to evaluate both the peak and residual strength of the interface between two tubes. Interface testing was also performed on the composite liner system to establish a reasonable interface strength value (both peak and residual) to be used in the slope stability analyses. The details regarding the methods of sample collection and analysis and results are described below.

2.0 SAMPLE COLLECTION AND ANALYSIS

Interface direct shear testing was performed in accordance with ASTM D5321. The geotextile-tube to geotextile-tube interface was modeled during testing by placing two samples of geotextile tubes against each other. The composite liner was modeled during testing using the following components (layered from top to bottom):

- concrete sand;
- non-woven geotextile (i.e., geotextile cushion);
- geomembrane; and
- compacted low-permeability soil.

Several types of geomembranes were tested. The geosynthetic material types and manufacturers are provided in Table 1. Samples of low-permeability soil were obtained from the Hansen Quarry in Jamesville, NY. The low-permeability soil was compacted to 95% of the maximum modified Proctor dry density at 3% of optimum water content.

Interface testing was performed at normal stresses of 700, 2,100, and 3,500 pounds per square foot (psf) to represent the potential range of pressures expected during SCA operation.

### 3.0 RESULTS

The peak and residual (i.e., large displacement) effective stress friction angles of the geotextile-tube to geotextile-tube interface were measured to be 15 degrees and 12 degrees, respectively. The peak effective stress friction angle of the composite liner system varied depending on the type of geomembrane tested. Based on these results, smooth HDPE geomembrane is not being considered for use on this project. Among the remaining geomembrane options tested, the peak effective stress friction angle varied from 19 degrees to 27 degrees, and the residual effective stress friction angle varied from 17 degrees to 18 degrees. The laboratory test report is provided in Attachment 1, and additional discussion of the results is provided in Appendix G, “Slope Stability Analyses for SCA Design” of the SCA Final Design.

LABORATORY TEST REPORT
Mr. David Steele  
Parsons  
290 Elwood Davis Road, Suite 312  
Liverpool, NY 13088  

Subject: Laboratory Test Results Transmittal  
Interface Direct Shear Testing  

Dear Mr. Barker,  

SGI Testing Services, LLC (SGI) is pleased to present the attached results for the above-mentioned testing program. The note section below addresses sample preparation, sample disposal and a disclosure statement.  

SGI appreciates the opportunity to provide laboratory testing services to Parsons. Should you have any questions regarding the attached document(s), or if you require additional information, please do not hesitate to contact the undersigned.  

Sincerely,  

Zehong Yuan, Ph.D., P.E.  
Laboratory Manager  

Attachments  

Notes:  
(1) Unless otherwise noted in the test results the sample(s)/specimen(s) were prepared in accordance with the applicable test standards or generally accepted sampling procedures.  
(2) Contaminated/chemical samples and all related laboratory generated waste (i.e., test liquids, PPE, absorbents, etc.) will be returned to the client or designated representative(s), at the client’s cost, within 60 days following the completion of the testing program, unless special arrangements for proper disposal are made with SGI.  
(3) Materials that are not contaminated will be discarded after test specimens and archived specimens are obtained. Archived specimens will be discarded 30 days after the completion of the testing program, unless long-term storage arrangements are specifically made with SGI.  
(4) The reported results apply only to the materials and test conditions used in the laboratory testing program. The results do not necessarily apply to other materials or test conditions. The test results should not be used in engineering analysis unless the test conditions model the anticipated field conditions. The testing was performed in accordance with general engineering testing standards and requirements. The reported results are submitted for the exclusive use of the client to whom they are addressed.
